

ABSTRACT OF THE DISCLOSURE

An air cleaning machine includes a main body having a front side formed with at least one air outlet, an ozonizer mounted in the main body and containing ozone, and a fan mounted in a rear side of the main body to blow the
5 ozone in the ozonizer outward through the air outlet of the main body. Thus, the air cleaning machine can blow the ozone to replenish the negative potential of the human body, thereby achieving the air cleaning and sterilizing effects.
